VI. Data Visualization Using PowerBi

AIM:

To learn the Power BI Desktop interface and workflow by connecting to Excel/CSV/SQL data sources, creating basic visualizations (bar, line, pie), writing calculated columns and measures (DAX), and assembling an interactive dashboard that answers simple business questions.

PROCEDURE:

1. Open Power BI Desktop & Inspect Interface
2. Launch Power BI Desktop.
3. Note key panes: Fields, Visualizations, Filters, Data/Report/Model view.
4. Switch to Data view briefly to understand where tables and columns appear.
5. Connect to Data Sources

A. Excel

1. Home → Get data → Excel → choose SalesData.xlsx.
2. In Navigator, check the Sales sheet and click Load.

B. CSV

1. Home → Get data → Text/CSV → choose Targets.csv.
2. Preview and click Load.
3. Clean & Transform (Power Query)
4. Home → Transform data to open Power Query Editor.
5. **For Sales table:**
    - Ensure Date column has Date datatype.
    - Create a TotalSales column: Quantity * UnitPrice (Add Column → Custom Column → =[Quantity]*[UnitPrice]).
    - Trim whitespace in text columns; remove duplicates if needed.

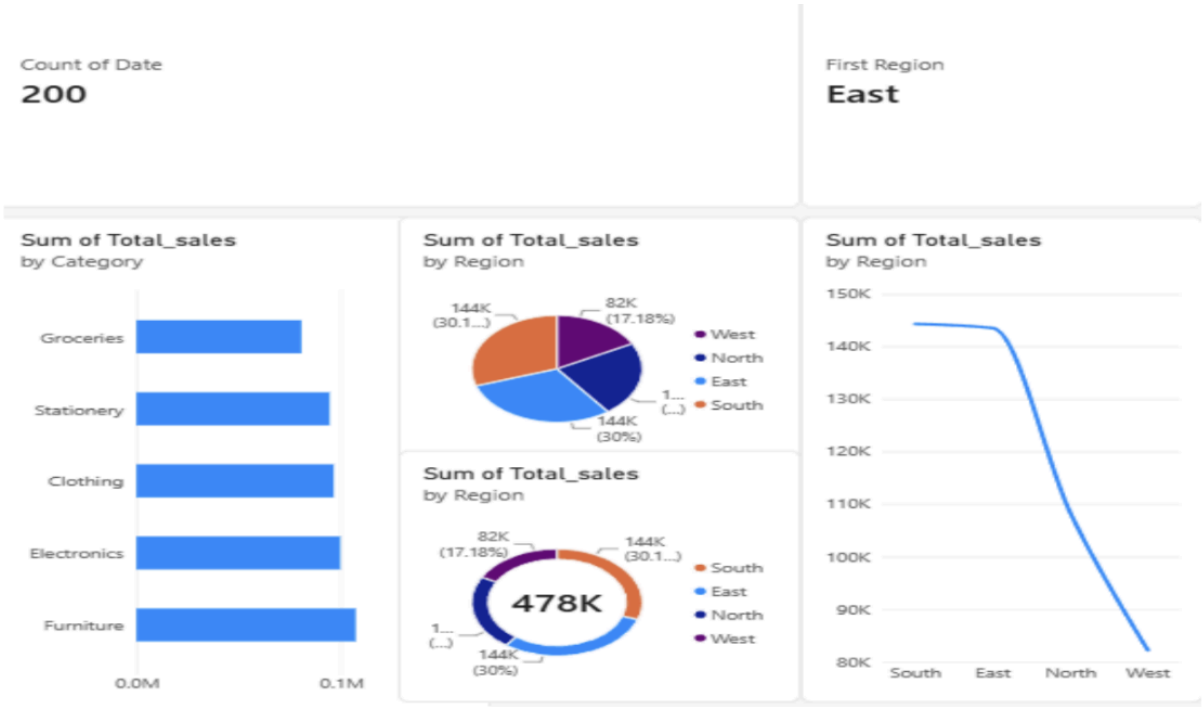

6. **For Targets.csv:**
    - Convert Month to date or text format consistently (e.g., YYYY-MM).
7. Close & Apply.

Create Basic Visualizations

Create a new report page and add visualizations:

1. **Bar chart — Sales by Category**
    - Axis: Category
    - Value: Total Sales
    - Add data labels, sort descending.
2. **Line chart — Monthly Sales Trend**
    - Axis: Sales[YearMonth]
    - Values: Total Sales
    - Add a slicer for Region.
3. **Pie chart / Donut — Sales proportion by Region**
    - Legend: Region
    - Values: Total Sales.
4. **Card visuals — Key KPIs**
    - Cards showing Total Sales, Total Quantity, Avg Order Value.
5. **Table / Matrix — Top 10 Products by Sales**
    - Columns: Product, Total Sales, Total Quantity.
    - Use Top N filter on Product to show top 10.
6. Build a Dashboard-like Report Page
7. **Arrange visuals into a clean layout:**
    - Top row: KPI cards and a date/region slicer.
    - Left column: bar chart (Category) & table (Top products).
    - Right column: line chart (trend) & pie/donut (region share).
    - Bottom: gauge or variance chart comparing sales vs target.
8. Add titles, tooltips, and consistent formatting (font sizes, number formats).
9. Save the .pbix file.

OUTPUT:

RESULT:

Thus, the given program was written and executed successfully.
